

地球的熱

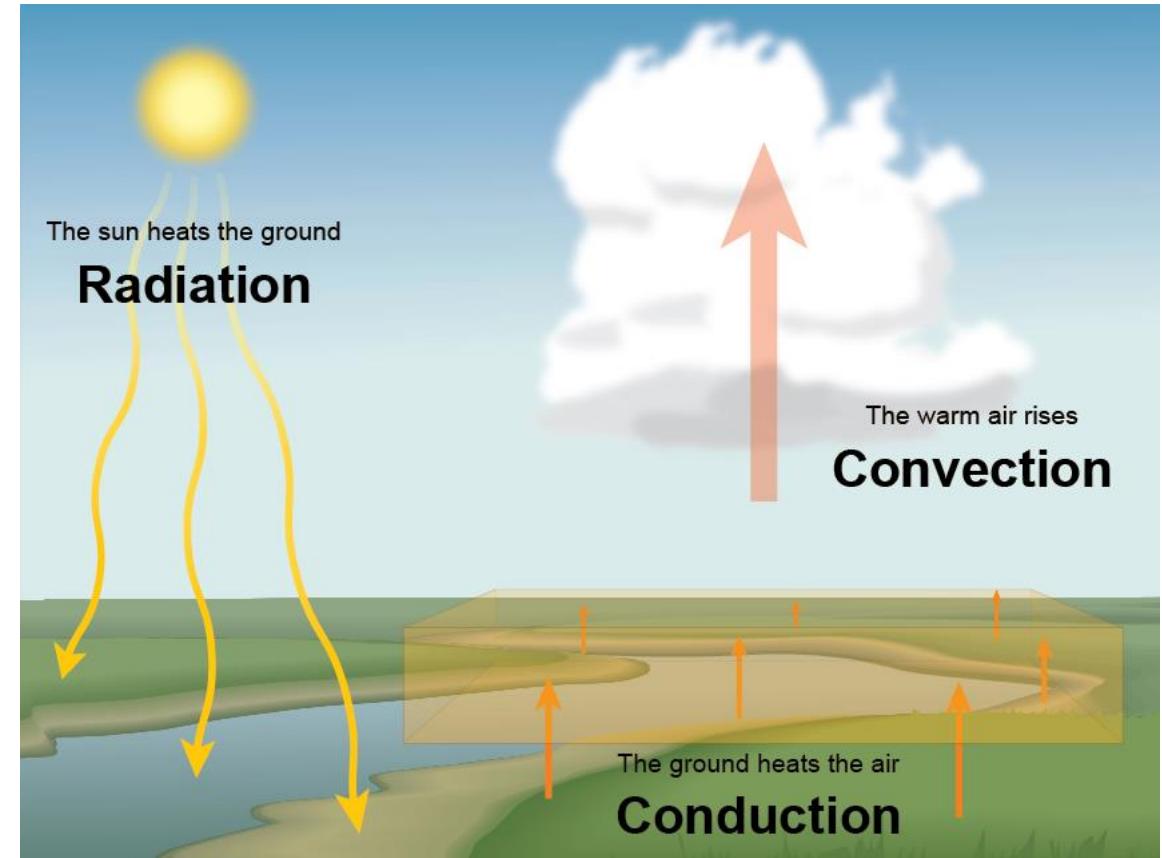

想想看

- 地球內部的熱從何而來？以甚麼方式降溫？
- 地球內部的熱對地球有甚麼影響？
- 地球外部的熱對地球有甚麼影響？

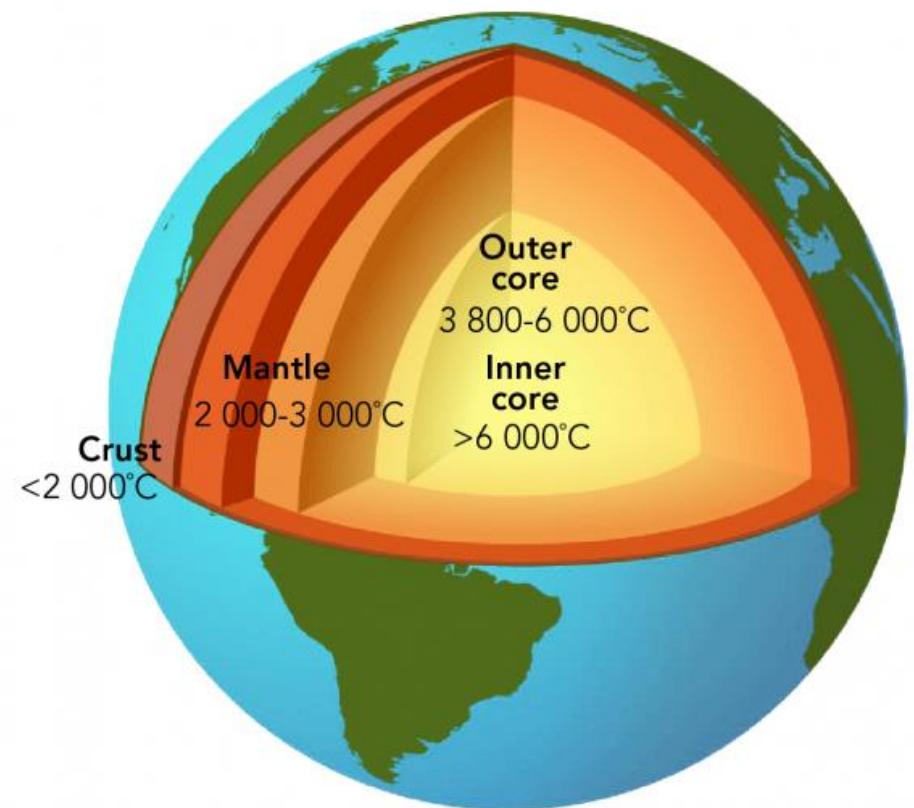

太陽輻射熱能

- The radiant energy from the Sun.
- Reflect into the space.
- Heat up the Earth's surface.

Earth's annual energy budget

Energy source	Annual energy [J]	Normalized [geothermal flux = 1]
Reflection and re-radiation of solar energy	5.4×10^{24}	≈ 4000
Geothermal flux from Earth's interior	1.4×10^{21}	1
Rotational deceleration by tidal friction	$\approx 10^{20}$	≈ 0.1
Elastic energy in earthquakes	$\approx 10^{19}$	≈ 0.01

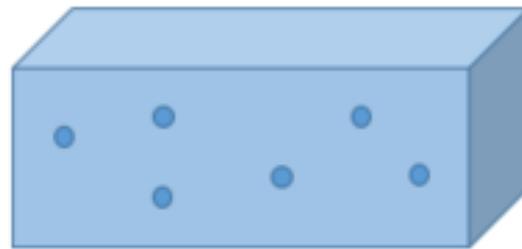

熱力學

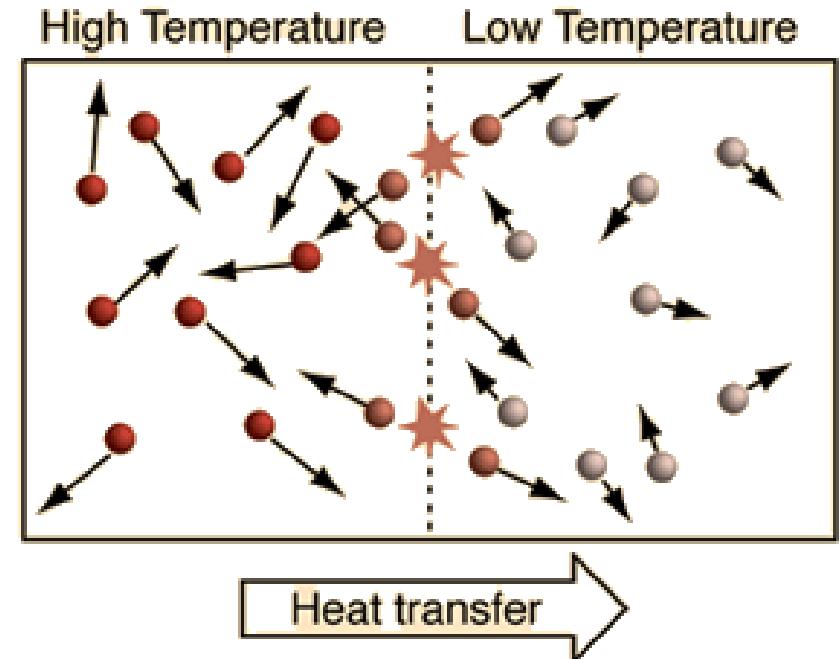

Thermodynamics

- Temperature and Heat.

Temperature:
How "hot" or
"cold" an object is.

Heat: is transferred to
the object. (ex. stove
heats pan).

The change of **temperature** of a gas is accompanied by changes of **pressure** and **volume**.

熱力學

Thermodynamics

- The unit of **energy** is called the joule.
- The unit of **heat energy** was defined as the amount needed to raise the temperature of one gram of water from 14.5 degree C to 15.5 degree C. This unit, the **calorie (cal)**, is equivalent to **4.1868 J**.
- The change **of heat energy in a unit of time**, known as the **power**. The unit of power is the **watt**.

熱力學

Thermodynamics

specific heat

$$\Delta Q = c_p m \Delta T$$

volume coefficient of expansion

$$\alpha = \frac{1}{V} \left(\frac{\partial V}{\partial T} \right)_p$$

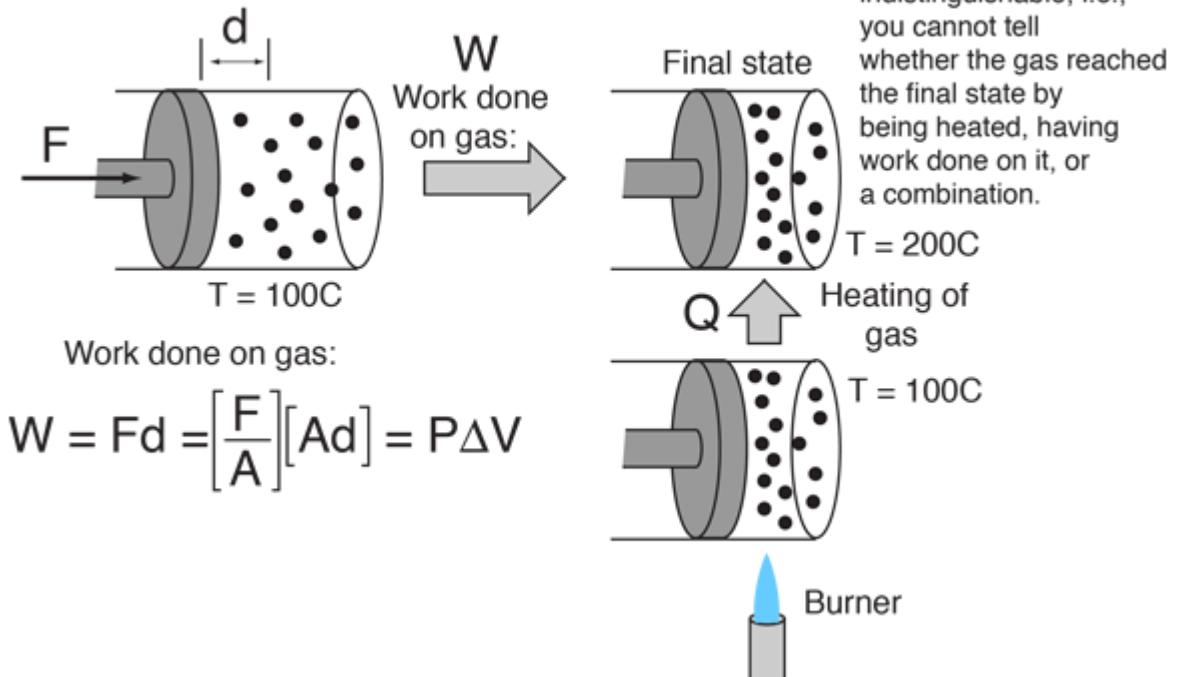

Heat transfer

$$\Delta Q = T \Delta S = \Delta U + \Delta W$$

thermal energy is added to a system

part is used to increase **the internal energy** of the system

part is expended as **work**, for example, by **changing the volume**

part is used to increase **the internal energy** of the system

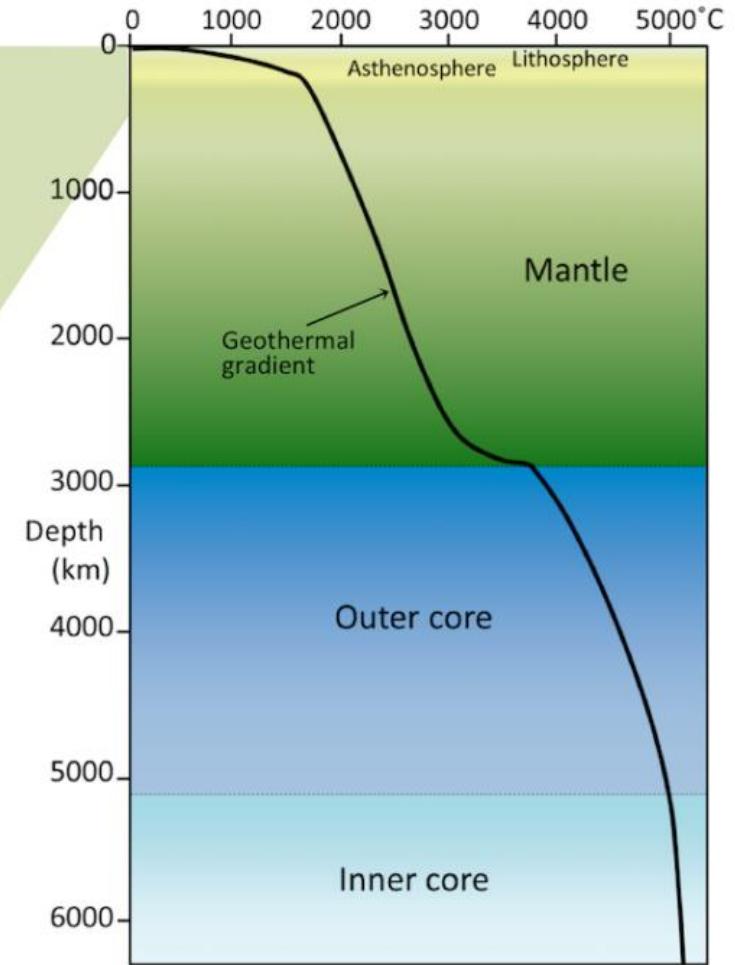

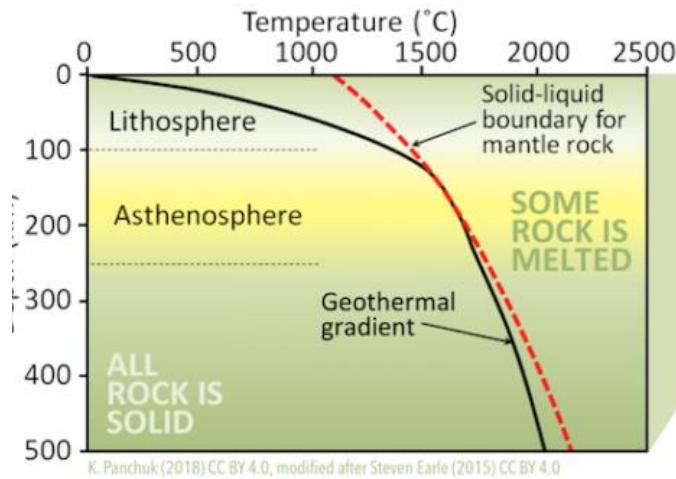

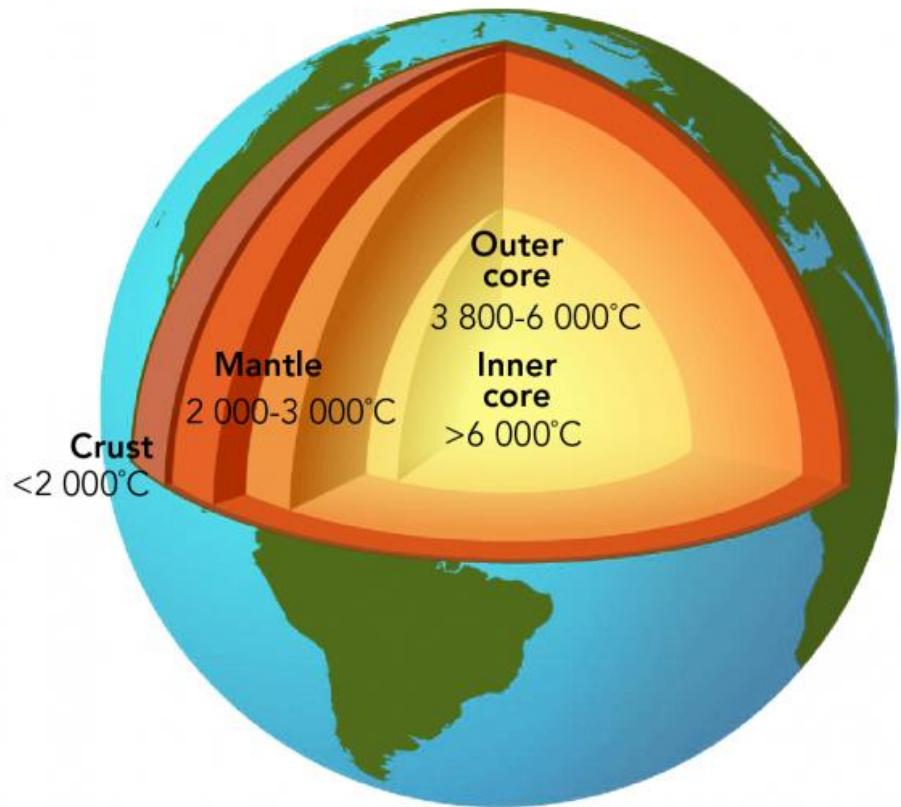

part is expended as **work**, for example, by **changing the volume**

地球內部的熱分布

30 K /km

200,000 K

Heat production rate and isotopic concentration

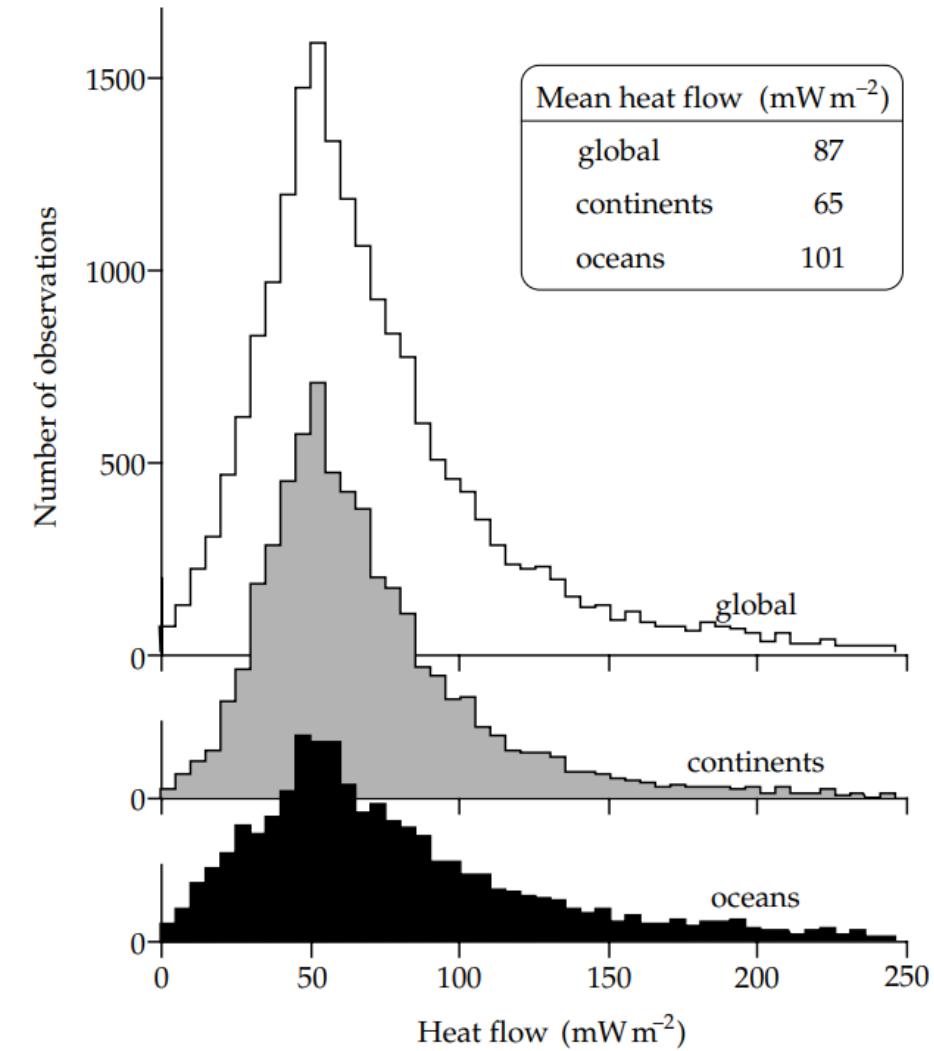

Rock type	Concentration [p.p.m. by weight]			Heat production $[10^{-11} \text{ W kg}^{-1}]$			
	U	Th	K	U	Th	K	Total
Granite	4.6	18	33,000	43.8	46.1	11.5	101
Alkali basalt	0.75	2.5	12,000	7.1	6.4	4.2	18
Tholeiitic basalt	0.11	0.4	1,500	1.05	1.02	0.52	2.6
Peridotite, dunite	0.006	0.02	100	0.057	0.051	0.035	0.14
Chondrites	0.015	0.045	900	0.143	0.115	0.313	0.57
Continental crust	1.2	4.5	15,500	11.4	11.5	5.4	28
Mantle	0.025	0.087	70	0.238	0.223	0.024	0.49

Earth Heat Flow

- The three main sources of the Earth's surface heat flow are
- (i) heat flowing into the base of the lithosphere from the deeper mantle,
- (ii) heat lost by cooling of the lithosphere with time, and
- (iii) radiogenic heat production in the crust

Main sources of heat flow

Heat source	Contribution to heat flow in:	
	Continents [%]	Oceans [%]
Cooling of the lithosphere	20	85
Heat flow from below the lithosphere	25	10
Radiogenic heat:		
upper crust	55	5
rest of lithosphere	40	—
	15	—

Main sources of heat flow
